

Animal Models of Ischemic Stroke

OVERVIEW

Rodent models of ischemic stroke

- Intraluminal suture MCAO model (acute: 1~3 days; chronic: 28 days)
- Photothrombosis model

Non-human primate models

- Middle cerebral artery occlusion by endovascular micro-coil placement
- Craniotomy model
- Transient (ischemia-reperfusion) or permanent ischemia

Clinical Assessment:

- Body weight
- Infarct volume: TTC Staining or MRI scanning
- Neurological defect test: Bederson Scale & Modified Neurological Severity Scores (mNSS) for rodents, specialized neurological evaluation scale for non-human primates
- Cognitive function/Anxiety-like behaviors: Morris Water Maze/Elevated Plus Maze Test, only for rodents

▲ Angiographic X-ray system from GE Healthcare

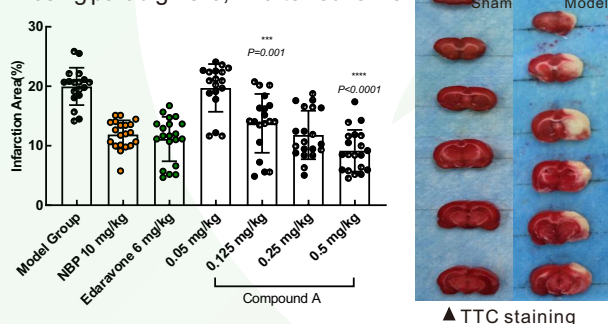

Case Study

■ Intraluminal Suture MCAO Model of Rats

- Animals: SD rats, male, 270~280 g
- Induction: occlusion of the middle cerebral artery for 2h, inclusion criteria: Bederson's scale ≥ 3 , 1h after ischemia
- Clinical Assessment: behavioral deficits and infarct volume (TTC staining), 24h after MCAO

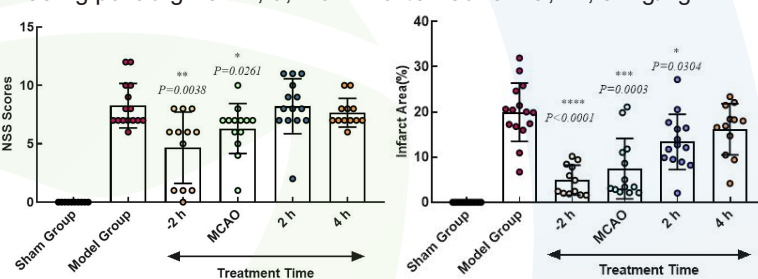

A 24-hour pharmacodynamics study

Dosing paradigms: 0, 2h after ischemia

A therapeutic time-window study

Dosing paradigms: -2, 0, 2 or 4h after ischemia, iv., 3 mg/kg

■ Non-Human Primate Model

- Animals: Rhesus monkeys, male, 4~8 kg
- Induction: the M1 segment of the middle cerebral artery was occluded with a custom microcoil for 2h, MCAO and reperfusion were confirmed by digital subtraction angiography (DSA)
- Dosing Paradigms: qd. $\times 21$ d, the first dosage was given 2h after reperfusion
- Clinical Assessment:
 - Body weight: qw;
 - Neurologic deficit score: pre, 1, 3, 7, 14, 21 days after MACO;
 - infarct volume: determined by MRI, pre, 1, 7, 14, 21 days after MACO.

▲ Digital subtraction angiography (DSA) imaging

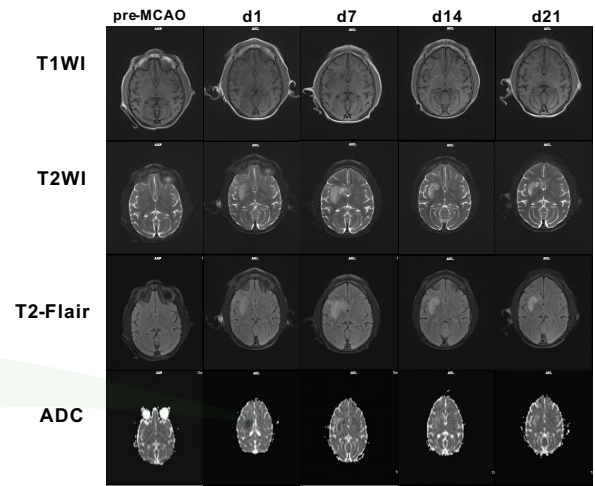

▲ Neurological evaluation scale specialized for NHP
 Journal of Neuroscience Methods 105 (2001) 45–53;
 Journal of Cerebral Blood Flow & Metabolism (2011) 31, 448–456

▲ Infarct volume, determined by MRI examination using a 3.0-T MRI before & after MCAO

* represents P<0.05 vs. Model group

Animal Models of Amyotrophic Lateral Sclerosis (ALS)

■ hSOD1-G93A Transgenic Mouse Model

▲ NeuN&ChAT staining

Animal Models of Alzheimer's Disease (AD)

OVERVIEW

Non-transgenic animal models

1. Naturally-aged rats
Readouts: behavior tests (memory and learning)
2. Senescence-accelerated mouse (SAM) model (SAMP8 mice)
Readouts: behavior tests (memory and learning), A β deposits
3. Scopolamine-induced models
Readouts: behavior tests (memory and learning), cholinergic function

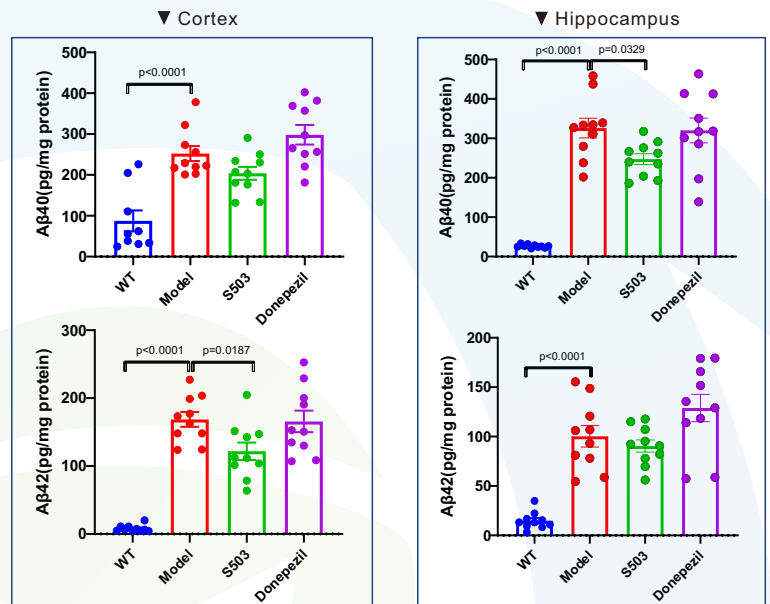

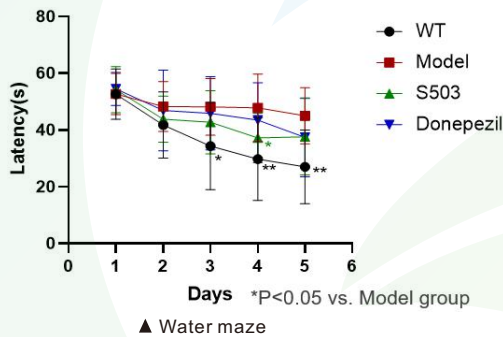

Transgenic animal models

- APP/PS1, APP/tau/PS1, 5xFad transgenic mice
- Readouts: Behavior tests, A β deposits, tau hyperphosphorylation, microglial activation, neuropathology.

Case Study

■ APP/PS1 Transgenic Mouse Model

- **Animals:** APP/PS1 mice, male, 9-month old (n=11)
- **Treatment:** Po., qd. \times 15 weeks
- **Clinical Assessment:** body weight, behavior tests, A β 40 & A β 42 expression in cortex and hippocampus, TNF α , IL-1 β mRNA expression in cortex

Animal Models of Parkinson's Disease (PD)

OVERVIEW

- **α -synuclein (A53T) transgenic mice**
Readouts: Behavior tests, nigral dopaminergic neurodegeneration, α -syn pathology, and neuroinflammation
- **MPTP-induced induced PD model (mice)**
Readouts: neuron loss, gliosis, behavioral dysfunction and dopamine secretion.
- **6-OHDA-induced PD model (rats)**
Readouts: neuron loss, gliosis, behavioral dysfunction and dopamine secretion
- **Pilocarpine-induced tremulous jaw movements (rats)**
Readouts: frequency and intensity of tremor

Case Study

■ Pilocarpine-Induced Tremulous Jaw Movements (Rats)

The number of TJMs was counted after the treatment of HB or L-DOPA treatment (qd \times 7d for HB, and qd \times 1d for L-DOPA) on rats received intraperitoneal administration of pilocarpine (4.0 mg/kg).

► Number of tremulous jaw movements (5 min)

*P<0.05 vs. Model group (n=12)
**P<0.01 vs. Model group (n=12)

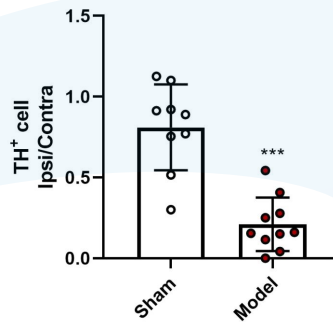

■ 6-OHDA-Induced PD model (Rats)

▲ Behavioral test

▲ Tyrosine hydroxylase (TH) immunostaining in substantia nigra
